#### ABSTRACT

The purpose of this study is to evaluate the effects of busing on the subsequent achievement performance of bused minority students. Differences in achievement gains are hypothesized to be a function of bused student attitudes toward busing and the interracial climate of acceptance in the receiving schools. The design of this study is that of a three year longitudinal panel with before busing and after busing achievement and attitudinal measures for bused and non-bused black students, and white receiving school students and teachers in Waco, Texas. Independent variables included in the analyses include measured intelligence, parental authority structure, educational expectations, self-concept, racial prejudice, integration attitudes, busing attitudes, school socio-economic climate and two measures of school interracial climate. Findings reveal the achievement performance of bused black students declined significantly from that of non-bused blacks. While all minority students had lower achievement scores after two years of busing, school interracial climate and the attitudes of bused students accounted for the significantly lower scores of bused students. The major conclusion is that rapid school desegregation in communities with great resistance to busing erodes student achievement performance. (Author/JM)

In our judgement, this document is also of interest to the clearinghouses noted to the right, Indexing should reflect their special points of view.

## Abstract

The purpose of this study is to evaluate the effects of busing on the subsequent achievement performance of bused minority students. Differences in achievement gains are hypothesized to be a function of bused student attitudes toward busing and the interracial climate of acceptance in the receiving schools. The design of this study is that of a three year longitudinal panel with before busing and after busing achievement and attitudinal measures for bused and non-bused black students, and white receiving school students and teachers in Waco, Texas. Independent variables included in the tabular, correlation and regression analyses include measured intelligence, parental authority structure, educational expectations, self-concept, racial prejudice, integration attitudes, busing attitudes, school socio-economic climate and two measures of school interracial climate. Findings reveal the achievement performance of bused black students declined significantly from that of non-bused blacks. While all minority students had lower achievement scores after two years of busing, school interracial climate and the attitudes of bused students accounted for the significantly lower scores of bused students. The major conclusion of the study is that rapid school desegregation in communities with great resistance to busing erodes bused student achievement performance.

## CHAPTER I

## RESEARCH PROBLEM AND OBJECTIVES

### A. Research Problem

While a variety of studies have indicated school desegregation has a positive effect on minority group student achievement and recent Supreme Court decisions have extended the use of busing to desegregate public schools and achieve racial balance, the results of the few studies conducted to evaluate the effects of busing on minority group student achievement are contradictory and inconclusive. 3 An answer to the question of whether busing is the best or even an appropriate means to achieve an equal educational opportunity for all, remains elusive and unanswered. The research outlined in this proposal is designed to evaluate the effects of busing for minority group student achievement. The major theoretical orientation guiding this study is that the utilization of busing as a technique to desegregate school facilities has a variable effect on minority group student achievement, due to motivational differences associated with student attitudes toward busing and the social-emotional, normative climate of receiving schools. Specifically, this research seeks to provide a resolution of the contradictory findings concerning the effects of busing on minority group student achievement by an analysis of the contribution of the intervening variable of student attitudes and self-concept.

Major national interest in educational inequality arose with the publication of findings from the Office of Education's

<sup>&</sup>lt;sup>2</sup>See Swann v. Charlotte-Mecklenburg Board of Education, 91 S. Ct. 1267 (1971); and the discussion of recent decisions in Inequality in Education, No. 10, 1971: pp. 3-6.

<sup>&</sup>lt;sup>3</sup>See, for example, Weinberg's (1970:82-85) discussion of studies on the effects of busing.

Educational Survey, commissioned by the Civil Rights Act of 1964; findings which revealed lower achievement levels for the children of racial and ethnic minority groups. In general, the major findings of the original analysis (Coleman, 1966) and secondary analysis (U.S. Commission on Civil Rights, 1967) point to the importance of the social context of the school, i.e., the socio-economic and racial-ethnic composition of the student body, for the explanation of differences in achievement. Since 1964, this nation has strengthened its commitment to provide an equal educational opportunity for all of its citizens. While there is virtual unanimity that such a goal is appropriate and worthwhile, there are serious differences as to the precise nature of this goal (Coleman, 1968:7-23) and as to the best strategy to achieve this goal (Day, 1968; McDill, 1969).

Agreeing with findings of several studies (Goodman, 1959; Wilson, 1959; Michael, 1961; Turner, 1964; Boyle, 1966) the Office of Education Report (Coleman, 1966) concludes that socio-economic composition of the schools' student body exerts the largest effect on student achievement scores. reanalysis of the survey data by McPartland and York (U.S. Commission on Civil Rights, 1967) concludes that regardless of social class, achievement scores of Negro students are higher as the proportion of whites in the school increases. This finding agrees with previous studies (Katz, 1964) and has been substantiated in more recent research (Armor, 1969; Pritchard, 1969; St. John and Lewis, 1971). While Weinberg (1970:294,304) notes a basic inconsistancy between the major conclusions of the two federally sponsored reports, Pettigrew (1971:62) concludes they are significantly related, due to evidence in the Coleman Report that only one fourth of the Negro population may appropriately be classified as "middle class." The relevance of these studies for government policy decisions is evident in Elliot Richardson's statement that racial balance in schools will improve educational opportunity and achievement for minorities (Richardson, 1970:52). With the Supreme Court's Swann decision and the utilization of busing to enforce the decision (Pottinger, 1971:6), one would expect to find achievement differences decreasing between majority and minority group students as educational opportunities are equalized.

The few studies which have been completed on the effects of busing offer contradictory and inconclusive findings. Banks and DiPasquale (1969) and Wood (1969) report bused minority students have greater interest in school and more favorable attitudes toward majority students than non-bused minority students. Moderate increases in achievement scores of bused Negro students are reported in studies conducted in East Harlem and Syracuse (East Harlem Project and City Commission on Human Rights, 1962; City School District-Syracuse, 1967). In addition to positive effects for bused minority students, Scudder and Jurs (1971) find there are no negative

effects due to busing for the achievement of majority students in receiving schools. Contradictory findings are reported by Teele, Jackson and Mayo (1966:297) and Moorefield (1967:145-146), with bused minority group students showing no increases in achievement in comparison with their non-bused counterparts. Gardner (1970) reports similar findings for Negro students in a parochial school busing program in Chicago. Reporting on both cross-sectional and longitudinal analyses of Riverside, California school data, Purl and Dawson (1971:3) find low and average achieving bused students achieve less in desegregated schools than in previously segregated schools. Only high achieving bused students achieved more in desegregated settings although this increase was not large enough to reduce the gap between majority and minority group student achievement levels. Purl and Dawson (1971:2) conclude that the achievement gap between bused and non-bused students is at least as high in 1970 as in 1966.

Part of the reason for these contradictory findings is suggested by Katz (1964) and concerns the motivational di-Katz maintains that psychological stress and anxiety experienced by Negros in competition with whites may retard or impair achievement motivation among those Negros with poor self-concepts. Of course, the question of whether there is a greater incidence of negative self-concept among Negros as among whites is debatable. Hodgkins and Stakenas (1969) conclude social class accounts for almost all of the differences in self-concept between the races. If the majority of the Negro population cannot be characterized as "middle class" (as suggested by Coleman, et. al., 1966) self-concept may be quite important in the explanation of achievement differences. This is confirmed by Katz (1968:59) who reports low achievers among minority group students have more negative self-concepts and self-evaluation. A similar conclusion is reached in the Coleman Report (1966:323-324) in which the student's sense of control of his environment (an aspect of self-concept) is positively associated with achievement score.

In addition to individual psychological differences with respect to self-concept, differences in social context are also important for the explanation of minority group student achievement. Interactionist theory suggests the responses of others are an important influence in shaping and modifying self-concept (Newcomb, 1950). The socioeconomic and racial-ethnic composition of the student body of a school constitute important educational social contexts. Coleman (1966:303-304) suggests higher educational aspirations of the student body in "middle class" schools serves to increase the level of achievement of minority group students in such schools. In a review of literature on the effects of integration on academic performance of Negros, Katz (1964) suggests integrated schools may provide new comparison levels for Negro self-evaluation. The acceptance or rejection of minority students by majority students,

however, may provide support or interference for minority student motivation to achieve (Katz, 1964). Pettigrew (1971:73-74) suggests the opportunity for cross-racial evaluation in desegregated schools leads to advances in achievement only if such comparisons occur in contexts which reflect majority student acceptance. Both the concepts of school "socio-economic" and "racial-ethnic" climate, utilize student self-concept and motivation to link structural compositional factors to individual achievement.

The degree of acceptance or rejection experienced by non-white bused students, as well as bused student attitudes toward receiving schools are conceptualized as crucial components of the normative climate of the receiving schools. This dimension is reflected in Pettigrew's (1971:63) concern to distinguish between desegregated and integrated school facilities. Whereas desegregation refers to the quantitative dimension of racial composition, integration refers to the qualitative dimension of interracial contact and the degree of mutual cooperation among student body and staff. grated schools in which interracial acceptance and cooperation has developed over time, are held to be conducive to raising minority student achievement. Desegregated schools, in which desegregation occurs abruptly, as with court ordered busing, may be non-effective for this purpose. In Moorefield's (1967) study of busing in Kansas City (in which no achievement gains were found), three fourths of the bused students were given low ratings on an acceptance scale by receiving students (Moorefield, 1967:167). In addition, two thirds of the bused students were regarded as "aggressive" by receiving Lower self-concept scores were observed among students. bused Negro students in schools in which acceptance by white receiving students was also low (Moorefield, 1967:166). Purl and Dawson (1971:18) suggest that the lack of increase in achievement among bused students in Riverside, California, was due to the lack of programs in desegregated schools to provide for a smooth transition of bused students to the new school's social structure. Whether the effect of busing is positive or negative for minority student achievement is hypothesized to be a function of the attitudes of the bused student toward busing and the new school, as well as the normative climate of acceptance or rejection communicated by the receiving school's students and staff; with whom he interacts.

## B. Research Objectives

1. To ascertain whether court ordered busing of minority group students to achieve racial balance in public schools in Waco, Texas, leads to increases in level

- of achievement for bused minority group students compared with non-bused minority students.
- 2. To determine majority and minority group student attitudes toward busing and the degree of interracial acceptance in Waco schools.
- 3. To evaluate the degree to which bused student attitudes and self-concept, and the normative climate of acceptance of receiving schools account for subsequent achievement performance of bused minority group students.

### CHAPTER II

## DESIGN AND PROCEDURES

## A. Design and Sample

The overall design is that of a three year longitudinal panel, although this design is one that emerged during the study and was not originally planned. The first and original wave of data collection in the spring of 1971, was conceived as a simple cross-sectional, ex post facto design to study the determinants of majority and minority student achievement levels and dropout rates. This original study was funded by a grant from the Cooper Foundation in Waco, Texas. The sample consisted of a random sample of 860 7th to 12th grade students in Waco public schools, stratified to insure adequate representation of grade levels, schools, and racial and ethnic minority groups. The racial/ethnic breakdown of the sample was 369 anglos, 295 blacks and 196 Mexican Americans. addition to I.Q. scores, achievement test scores, self-concept and achievement value orientation scores, and routine demographic information collected from school records and a survey, aggregative measures for each school's normative and socioeconomic climates were derived. The questionnaire for this wave is found in Appendix C.

During the summer of 1971, federal courts ordered the Waco Independent School District to bus 1,600 black students to previously all white schools to create a more favorable racial balance. Approximately 125 black students from the original sample were to be bused. The "before" measures on achievement, self-concept and school climates, indicated a potential for research seldom available to social scientists. Thus, a proposal for Office of Education support was formu-Due to the passage of time required for proposal acceptance, contract negotiations and instrument clearance, it was decided to conduct a second year of data collection with local support and request Office of Education funding for a third year of data collection and the final analysis. Notification from the Office of Education about the grant was received during the second year of the study.

Data for the second wave were collected in the spring of 1972 from two separate samples of respondents. To provide for the longitudinal aspects of this study, 240 black

students from the original smaple (105 of the 240 are bused students) were resurveyed to provide a second measure of self-concept and integration attitudes. In addition measures on attitudes toward busing and interracial association from the Equality of Educational Opportunity Survey (1964) were included. The separate questionnaires for bused and non-bused black students for the Spring of 1972, Form A and Form B, are found in Appendix D. The second sample of respondents consisted of a random, corss-section of students and teachers from each school. Data from this sample were used to construct aggregative measures of school educational, normative and socioeconomic climates. Students were surveyed with the above mentioned 1972 questionnaire, Form A, found in Appendix D. Teachers were surveyed with 1972 questionnaire, Form C, found in Appendix D.

Data for the third and final wave are composed of two types. The first type consists of 55 bused and 62 non-bused black students from the original sample. The remainder of those surveyed in 1971 and 1972 had either dropped out, transferred or graduated. This first group of 117 were retested with the California Achievement Test and resurveyed (for the third time) with the 1973 questionnaire, Form D, found in Appendix E. The second type of data consists of a random, cross-section of students from each school, surveyed with the 1972 questionnaire, Form A to provide for the construction of additional aggregate measures of school educational and socio-economic climates. While a complete printout of responses to all questionnaire items was not deemed necessary to meet the objectives of this study, such data are available, on request, from the principal investigator.

Routine demographic information about the bused and non-bused black students who were followed through the entire three year period, and who provide the sample upon which the results and conclusions of this study are based, are presented in Tables 1 and 2.

## B. Procedures and Methodology

Operational definitions of critical variables and concepts as well as procedures used in the construction of indices are found in Appendix A. Differing strategies of analysis are used for the three different objectives of this research. Tabular analysis with appropriate tests of statistical significance are utilized to ascertain whether court ordered busing leads to increases in achievement for bused minority students. A similar methodology is used for the second research objective; to determine the degree of interracial acceptance in Waco schools and to determine majority and minority student attitudes toward busing.

Total	Male Female	18 12	23 21	8 25	5 4	54 62
Total		30	44	33	9	116*

<sup>\*1</sup> Observation Missing

For the third and final research objective, correlation and multiple regression techniques are used since they provide for a more powerful evaluation of complex relationships, are more appropriate for causal analysis and permit the relative effects of contextual and individual factors to be weighed with all other independent variables controlled. Dummy variable techniques (Suits, 1957) are used for noninterval scale variables and dichotomous variables (Boyle, 1966; Coleman, 1970; and Lyons, 1971). Regression analysis is used to identify those variables contributing the largest amount of variance to the dependent variables of student achievement. In addition, path coefficients (McDill, Myers and Rigby, 1967; Blalock, 1968; Borgatta, 1969; Land, 1969; Lyons, 1971) are used to select those factors which have the most direct effects upon achievement scores.

#### CHAPTER III

### ACHIEVEMENT LEVEL DIFFERENCES

The results of this study are presented in three chapters, corresponding to the three research objectives specified in Chapter I. The first objective, considered in this chapter, is to ascertain whether court-ordered busing of minority students to achieve racial balance is beneficial to those students who are bused. Specifically, the question is whether bused minority students show increases in achievement performance compared with their non-bused peers. Measures used for achievement in this study are standardized scores for total math, total reading and total battery from the Intermediate and Advanced Forms of the California Achievement Test.

## A. Achievement Differences Prior To Busing

The Intermediate Form of the CAT was administered by Waco Independent School District personnel as part of normal school testing procedures and was given at least one year prior to the court's busing order. Differences in achievement scores between bused students and non-bused students, prior to busing, are presented in Table 3. While one would not expect large differences in achievement scores if students had been randomly selected for busing assignment and T-tests reveal differences are not statistically significant, non-random assignment policies exercised an obvious effect, with bused student achievement scores being consistantly lower. Tables 4 through 6 present the same information in a slightly different form, with achievement scores separated into high and low score categories and with a chi square test of statistical significance performed. None of the differences in achievement scores between bused and non-bused students, prior to actual busing, are statistically significant. Thus, while there is a trend for bused students, prior to busing, to have lower measured achievement scores than their non-bused peers, these differences are concluded to be statistically insignificant and substantially inconsequential.

TABLE 3 MEAN SCORES INTERMEDIATE FORM, CALIFORNIA ACHIEVEMENT TEST, PRIOR TO BUSING

## B. Achievement Differences After Busing

Turning attention to differences in achievement after busing, Table 7 presents achievement scores for both bused and non-bused groups on the Advanced Form of the California Achievement Test, which was administered by a research consultant during 1973, almost two years after court ordered busing was in progress.

TABLE 7 MEAN SCORES ADVANCED FORM, CALIFORNIA ACHIEVEMENT TEST, AFTER BUSING

Busing Status	Statistic	Total Math Scores	Total Reading Scores	Total Battery Scores
Bused Students	Mean Standard	60.96	50.77	200.68
·	Deviation	21.96	15.15	55.06
Non-Bused	Mean	65.73	58.59	233.95
Students	Standard Deviation	23.77	19.54	63.28
Total	Mean Standard	63.53	54.89	213.21
IOCAI	Deviation	22.98	18.03	60.51
T-Test S	ignificance =	.184	.016	.038

Differences in mean achievement scores are noted between the bused and non-bused groups of black students, with bused students having significantly lower scores than non-bused students. Two general observations are in order before moving on to the detailed tables and other statistical tests. First, all groups of test scores have declined by the end of the study period as compared with scores at the beginning (Table 3). Comparing the row totals from Tables 3 and 7 reveals that the total sample has declined in achievement relative to their earlier position. Whereas the mean score for the total CAT battery was 253.62 at the beginning of the

study, the mean at the conclusion is 213.21. Both bused and non-bused black students have lost ground in the 2 to 3 years between CAT tests. Relative to their white peers, who form the majority on whom such tests are standardized, black students in this study achieve relatively less, the longer they are in school. This might be due to specific school and/or community conditions in Waco, but probably reflects trends observed nationally. The second observation to be made from Table 7 is that differences in achievement levels have widened between the bused and non-bused groups. Whereas only 5 percentage points separate the mean total battery scores for the two groups prior to busing (as depicted in Table 3), a 33 percentage point difference is observed between these groups after the period of busing (Table 7). While all black students in this sample have lost ground with respect to their achievement performance, bused students have lost the most.

Separating achievement scores into standard deviation categories, the relationship between busing status and level of achievement is examined in detail for the various tests, in Tables 8 through 10.

TABLE 8 TOTAL MATH SCORES, AFTER BUSING, BY RESPONDENT'S BUSING STATUS

Total	10%	<b>7</b> 0%	10%	10%	100% (117)

Inspection of Tables 8 through 10 reveals statistically significant differences in score distribution between bused and non-bused students for all three measures of achievement. Bused students achieve significantly less than their non-bused peers on all three achievement measures. The extent of the decline in achievement is detailed in Table 11.

TABLE 11 AVERAGE DECLINE IN ACHIEVEMENT BY BUSING STATUS

<del></del>	<del></del>			
Busing Status	Statistic	Total Math Score	Total Reading Score	Total Battery Score
Bused Students	Mean Standard	-14.19	-31.39	-51.12
	Deviation	21.38	14.27	52.73
Non-Bused	Mean	-12.62	-26.28	-32.55
Students	Standard Deviation	18.29	16.69	51.45
Total	Mean	-13.35	-28.68	-41.10
Sample	Standard Deviation	19.72	15.74	52.64
T-Test	Significance =	.174	.062	.049

While it is not the intention to analyze the determinants of these differences in achievement in this section, it appeared appropriate to investigate whether certain select variables were also significantly related to achievement differences, and in particular, to the differences between bused and non-bused students. Variables included in this early pre-analysis are the sex, age and grade of the respondent, measured I.Q., and parental socio-economic status. Of all of these variables, only one is significantly related to achievement performance; measured I.Q. None of the achievement differences between sex, age, grade, parental socio-economic status and any of the three sets of achievement test scores are statistically significant. The relationship between measured I.Q. and achievement test performance is presented in Table 12.

17

## TABLE 12 ACHIEVEMENT TEST PERFORMANCE BY RESPONDENT'S MEASURED I.O.

## Achievement Test Scores

Measured I.O.

	Total Math	Total Reading	Total Battery
High (Above Median)	76.59	64.51	249.68
Low (Below Median)	52.45	47.45	184.71
T-Test Significance	= .041	.000	.004

All T-Test scores are statistically significant, revealing that students with higher levels of measured intelligence achieve significantly higher on all three CAT measures.

The question of whether I.Q. accounts for all of the difference in achievement scores between bused and non-bused black students is addressed next. Table 13 presents data for this relationship. Significant differences in achievement performance of bused and non-bused students persist (with the exception of math differences among lower I.Q. students) with measured intelligence controlled. The magnitude of mean achievement score differences between high and low I.Q. students is larger than mean achievement score differences between bused and non-bused students. Obviously, I.Q. is a major determinant of achievement. Even with I.Q. controlled, however, significant achievement differences between bused and non-bused students remain.

In addition to investigating the relationship of the previously mentioned selected variables with 1973 Achievement Test scores, the question of whether such variables are related to achievement score changes needs to be considered. This question is slightly different than the previous one, since the change in achievement (positive or negative from the CAT given prior to busing, to the CAT given after busing)

TABLE 13 ACHIEVEMENT TEST SCORES AFTER BUSING BY RESPONDENT'S BUSING STATUS CONTROLLED FOR MEASURED I.Q.

is the dependent variable here. Table 14 presents the relationship between measured intelligence and changes in achievement test scores.

TABLE 14 ACHIEVEMENT TEST SCORE CHANGES
BY RESPONDENT'S MEASURED I.Q.

Achievement Score Changes

Measured I.Q.

	Math	Reading	Battery
High	- 4.84	-23.20	-12.54
Low	-19.96	-33.18	-62.33
T-Test Significance	= .000	.003	.000

Measured I.Q. is significantly related to changes in respondents' achievement test scores. As expected, higher I.Q. students have a significantly lower magnitude of loss in achievement than low I.Q. students. Table 15 presents this relationship by the respondents' busing status.

From inspection of Table 15, it is obvious that measured intelligence is a major determinant of changes in achievement performance, and this relationship holds for both bused and non-bused students. Even with I.Q. controlled, however, busing status appears to exert a statistically significant effect on achievement test performance; with non-bused students (with the exception of the changes in math scores) showing a smaller magnitude of loss than bused students. While the correlation and regression analysis of Chapter V will explicate the precise nature of these relationships, it seemed appropriate to present the effect of measured intelligence upon bused and non-bused minority student achievement performance in this section.

Whereas all of the black students in this sample achieved less well after the passage of time between the

ERIC Full Text Provided by ERIC

administrations of the two forms of the California Achievement Test, bused black students exhibit a significantly larger decline in achievement performance than non-bused black students. The major conclusion of this section is that busing black students to previously all white schools to achieve racial balance does not benefit the achievement performance of the bused students. Busing serves to erode achievement performance so that bused black students have significantly poorer achievement than black students not bused. Standard deviations in Table 11 are fairly large, however, indicating some students do much better; others, worse. Chapter V will causally analyze why some students achieve more than others. Suffice it for this chapter to observe the differences in achievement levels and to make the tentative conclusion that busing weakens the achievement performance of black bused students as compared with their non-bused black peers.

### CHAPSER IV

# ATTITUDES TOWARD BUSING AND INTERRACIAL ACCEPTANCE IN WACO SCHOOLS

The second research objective is to determine majority and minority student attitudes toward busing, and the degree of interracial acceptance in Waco schools. Basic to this objective are answers to questions such as the attitudes of the student body of the receiving school about busing, bused minority students and integration. How do those students who are bused evaluate their busing experiences? Much of the discussion about busing has been clouded in a political smokescreen. The intention of this research objective is to find out what the participants themselves, bused students, receiving white students and teachers think about busing, school desegregation and integration. Findings will be presented in four sections in this chapter; attitudes of bused black students, attitudes of white receiving students, attitudes of receiving school teachers and the degree of interracial acceptance in Waco schools.

## A. Attitudes of Bused Black Students

## Attitudes Toward Busing

The experiences of the bused students are held to be crucial for the development of subsequent achievement. this section, we report the responses of bused black students to a variety of items relating to their busing experiences. For comparison purposes, the responses of non-bused black students in the sample are included where appropriate. the following Tables, VAR112 is the respondent's busing status; with a yes signifying the respondent is being bused, a no signifying the respondent is not being bused. Table 16 presents responses to Question 51 from Questionnaire Form D, how do you feel about busing to achieve racial balance in Waco schools. Of bused students only 9% have a positive attitude toward busing, with 35% indicating a negative atti-Over half of the bused students, 56%, are neutral toward busing. No significant differences are observed between bused and non-bused student responses to this question.

Table 17 presents a crosstabulation of bused student attitudes toward busing, with why they consider busing to be advantageous (Question 70, Form D). The predominant category chosen for the reason busing is viewed advantageously is the category of personal reasons. Even 16 students with negative attitudes toward busing generally thought busing provided some personal advantages such as more time to be with friends, and less walking. Only a few thought busing provided them with a better school or helped to integrate Waco schools. Table 18 presents the crosstabulation of bused student attitudes toward busing with their objections to busing (Question 71, Form D). The predominant category again, has to do with personal reasons, such as having to get up earlier, and having to ride noisy and smelly buses, 2 of 73 students objected to busing for racial reasons, indicating they would rather not associate with whites.

Responses to the question of how most of their friends feel about busing (Question 50, Form D) are presented in Table 19. The majority of the friends of both bused (60%) and non-bused (74.2%) black students have negative attitudes toward busing. Interestingly, however, almost twice as many friends of bused students have positive attitudes toward busing compared with the friends of non-bused students. Differences between the two groups are not statistically significant. Table 20 presents the relationship between the respondent's busing status and his or her parents' attitudes toward busing. The parents of bused students tend to have more favorable attitudes toward busing than their bused sons and daughters or the friends of their children. 20% of bused student's parents have positive attitudes toward busing compared with 9.8% of the parents of non-bused students. If one percentages down the columns instead of across the rows allows an interpretation to be made, that two-thirds of the parents with positive attitudes toward busing are those whose children are bused. Chi square statistic reveals, however, that the distribution of responses in the table is not statistically significant from a chance distribution.

Responses to the question of whether the advantages of busing outweigh the disadvantages (Question 48, Form D) are shown in Table 21. While a slight trend indicates a larger proportion of bused students see advantages outweighing disadvantages, differences are small and not significant. Data for whether busing is viewed as the most effective way to achieve school integration (Question 43, Form D) are presented in Table 22. Although differences are not statistically significant, 53% of the bused students agree with this statement, compared with 41% of the non-bused students. Another item which taps attitudes toward busing focuses on the degree to which the respondent favors the use of busing to other than the neighborhood school. Responses to this item (Question 32, Form D) are shown in Table 23. While

differences between groups are not statistically significant, 31% of bused students favored this compared with 23% of the non-bused students. Thus, while bused students are not very positive about being bused (Table 16, 9% are positive), they are more positive (Table 23, 31% in favor) about busing students in general.

The two major objections to busing that the courts will admit as possible evidence cover situations in which busing is either a risk to the health of the child or hinders the learning process. Of course the courts have substantial evidence in mind for such situations; evidence such as medical reports, etc. Nevertheless two items were included to measure bused and non-bused student attitudes toward these questions. Responses to the question of whether busing is a risk to the health of students (Question 44, Form D) are found in Table 24. While differences are not significant at the .05 level, there is a definite trend in the relation between these variables. If one takes a liberal position with respect to significance, a greater proportion of bused students (58%) see busing as a risk to physical health, than non-bused students (47%). Responses to the question of whether busing hinders the learning process (Question 45, Form D) are found in Table 25. The majority of both groups do not think busing hinders the learning process. Thus, black students do not see busing as a significant risk to student health nor do they see it as hindering the learning process.

An interesting similarity of agreement between bused and non-bused student responses occurs with an item designed to ascertain whether the money used for buying school buses might better be used to upgrade substandard schools (Question 47, Form D). Table 26 presents this data. 84% of bused students and 87% of non-bused students agree with this policy. A similar configuration of opinion occurs with respect to student attitudes on teacher reassignment (Question 46, Form D). 92% of bused students and 91% of non-bused students agree that black students could receive the same quality education as white students if top quality teachers were relocated in a fair distribution among high schools. Thus, both the alternatives of upgrading substandard schools and the relocation of quality teachers were highly esteemed by minority students in this study.

One final question relating to black student attitudes toward busing involves parents appraisal of the school the respondent is attending (Question 57, Form D). Differences observed in Table 28 are statistically significant. Whereas 70% of the parents of non-bused students have a positive appraisal of the school, only 35% of the parents of bused students have positive appraisals of the receiving schools to which their children are bused. Three times as many

parents of bused students are dissatisfied with the school their child attends as parents of non-bused students.

Attitudes of black students toward busing, as reported in Tables 16 through 28, indicate few significant differences between black students bused to previously all white schools and black students who are not bused. The only significant difference between the two group's attitudes toward busing are differences in parental appraisal of respondent's schools. A significantly higher proportion of the parents of non-bused students have positive appraisals of their children's schools. Bused students' parents have more negative appraisals. For the most part, bused black students are neutral in their personal attitudes toward busing while the majority of their friends view busing negatively. The majority of black parents are neutral toward busing, although a greater number are negative than positive. Bused students cite personal reasons most often for a justification of their views of busing as advantageous or disadvantageous. The overwhelming majority of black students would rather see substandard schools upgraded and quality teachers relocated, than the program of busing, although most do not think busing hinders the learning process.

Attitudes Toward Classroom Compositional Factors Another set of items important for an understanding of black student attitudes toward desegregated school settings concerns student attitudes toward classroom composition. The question to be answered in this section is whether after being bused for two years to a previously all white segregated school, bused black students have different attitudes toward classroom compositional factors than their non-bused black peers. Table 29 presents data for the compositional factor of the number of white students desired in school (Question 52, Form D). Differences between groups are not significant. Whereas 49% of non-bused students choose the categories of no white students or less than half white students as the desired number for their ideal school, 61% of bused students choose these categories. More bused students desire fewer white students in school than non-bused students. A closely related question concerns the number of white teachers black students want in their ideal school (Question 53, Form D). Again, while the differences between bused and non-bused groups are not significant, over half of each group chose the none or less than half categories. Thus, for both questions, the majority of black students are of the opinion that none or less than half are the appropriate number of white students and white teachers to have at school. Attendance in a newly desegregated school for two years does not appear to have exercised any effect on bused student responses to these items.

Another item asked of students concerned the type of racial mix the respondent thought would be of highest benefit to them academically (Question 54, Form D). Differences in responses between the two groups are statistically significant, with bused students choosing the all black setting more than any other category. Non-bused student's largest response category is the integrated school setting. It would appear the experiences of the bused black students are predominately negative toward integration. A significant minority of bused students (9.3%) however, did choose predominantly white schools. Responses of bused students to this item are probably related to their busing experience, with those bused students who view busing negatively choosing an all black setting.

Related to the consideration of classroom composition are minority student attitudes toward black and white teachers. Two items measured these attitudes. Table 32 presents data for the relationship between teacher patience and teacher's race (Question 55, Form D) and Table 33, data for the relationship between teacher's race and subject stimulation (Question 56, Form D). No significant differences between groups are observed. The majority of minority students see white and black teachers about equally as patient and about equally as stimulating.

Two final items were asked in order to determine whether busing had any effect on the way in which minority students evaluated themselves in comparison to others. Table 34 presents data for the degree to which respondents perceive the school's teachers to be interested in them as persons (Question 29, Form D). A significantly higher number of nonbused students perceive their teachers as interested in them than bused students do. Whereas 81% of non-bused students experience teacher interest, only 51% of bused students perceive such interest. Table 35 presents data as to the degree to which respondents perceive their brightness in comparison to others (Question 35, Form D). From inspection of Table 31, it is observed that the majority of black students perceive themselves as being average in brightness, compared to others in their school. Differences between bused and non-bused groups are not significant, however, a smaller proportion of bused students perceive themselves to be above average in brightness or among the brightest.

After two years of busing, bused student attitudes toward classroom compositional factors are not significantly different from those of non-bused blacks. Of the data presented in Tables 29 through 35 bused and non-bused students differed significantly in response to only two items: the desired racial mix of school and perceived teacher interest. Bused students overwhelmingly desire an all black school setting and do not perceive their teachers to be as interested in them. Non-bused students overwhelmingly choose an integrated racial school setting. Tentatively it would appear

that the experience of being bused to desegregate previously all white Waco schools has influenced bused students to move away from an integrated model of racial mix to a separatist model of education. With respect to the other items on classroom composition, bused black student attitudes do not differ significantly from those of non-bused black students. Generally speaking, the majority of black students think the number of white students and teachers in their schools should be less than half, although they do not think white and black teachers differ that much in the degree of patience extended to them or in their ability to stimulate students to study. The majority of black students think their teachers are interested in them as persons and perceive themselves as average or above average in brightness in comparison with their fellow students.

3. Attitudes Toward Integration

A third and final set of items considered to be of potential significance in assessing bused student attitudes are those which attempt to measure whether busing has resulted in any changes in attitudes toward school desegregation and social integration in general. One theory used in some desegregation studies holds that while desegregated settings may or may not provide for a closing of the achievement gap between blacks and whites, desegregation has positive effects for the development of more favorable attitudes to ard integration and an integrated society. Table 36 presents data for responses to the question of whether students think racial integration of public schools is a desirable goal (Question 38, Form D). While the two groups do not differ significantly in their answers, the overwhelming majority of black students agree that public school integration is a good thing. while a large proportion of black students are critical of busing as a procedure to achieve school desegregation, they are not against school desegregation per se, but the form it takes in busing.

Table 37 presents data for attitudes as to whether school integration raises the educational attainment of minority students (Question 39, Form D). The majority of black students are of the opinion that school integration raises the educational attainment of minority students. Differences between bused and non-bused students are not significant. Table 38 presents student responses as to general social integration (Question 31, Form D). The overwhelming majority of black students favor general racial integration, with differences between bused and non-bused student answers not significant. Table 39 presents data for the relationship between busing status and perceived racial prejudice (Question 30, Form D). The majority of both groups of black students are of the opinion they have little racial prejudice. A smaller but non-significant, proportion of bused students feel they have little racial prejudice.

To sum up this section, the expected significant differences between bused and non-bused student attitudes toward integration did not materialize. Bused students do not have more favorable attitudes toward integration. Busing to achieve school desegregation does not appear to have contributed to any changes in student attitudes toward integration or the amount of perceived racial prejudice. Trends are opposite the predicted direction, with bused students having slightly less favorable attitudes toward integration. The majority of both bused and non-bused black students are favorable toward general racial integration in society and toward school integration, viewing the integration of schools as contributing to higher educational achievement levels of minority students.

## B. Attitudes of White Receiving Students

A second aspect of the research objective being considered in this chapter is to determine majority student attitudes toward busing and school desegregation. An important component of the experience of bused minority students is the reception they receive from white students in previously all white segregated schools. The attitudes of white receiving students may prove to be an important determinant of the attitudes, experiences and educational achievement of the bused minority students. Responses of white students, some in receiving schools, some not, to a variety of items are presented in this section.

White students were asked about the number of white students they desired to have in school (Question 26, Form A). Responses for white students in Table 40 are separated into two categories: white students from receiving schools and white students from non-receiving schools. A chi square statistic is calculated for the significance of the distribution of responses among white students. For comparison purposes the responses of black students to the same question are included. Inspection of the differences between white and black students reveals white students prefer a higher proportion of white students in their schools than black students prefer. Whereas only 1% of black students desire more than half of their school to be white 62% of all white students desire such a student body. Among the white students, a statistically significant difference appears with whites from receiving schools disproportionately wanting more than half of their student bodies to be white. Whereas only 47% of whites from non-receiving schools want more than half of their fellow students to be white, some 77% of white students in receiving schools feel this way. Thus it would appear that the experience of attending a previously all white school

Chi Square	п	2.925	With 4 D.F.	ſ	Significance	= .0952	

that is currently receiving bused minority students has the effect of increasing the number of white students wanted in the school by white receiving students.

A similar question concerns the number of white teachers desired in school by students (Question 27, Form A). Differences in response between white students and black students are not significant. The overwhelming majority of students of both races favor half or more of their teachers to be white. Differences between white receiving students and white students from non-receiving students are not significant at the .05 level. 18% of black students want less than half of their teachers to be white, compared with 8% of white receiving students and 5% of white students from non-receiving schools.

Another area related to white student attitudes concerns student appraisal of the degree to which teachers are interested in them as persons and communicate a spirit of interest and concern to the student (Question 36, Form A). Differences between black and white students are not significant. Two-thirds of the students of both races perceive their teachers to be interested in them. The response differences among the white students are statistically significant, however. White students in receiving schools are significantly less likely to perceive their teachers interest than white students in non-receiving schools. Two interpretations of this finding are possible. Either the climate is actually different in receiving and non-receiving schools such that both black and white students objectively perceive this climate, or white students in receiving schools do not perceive their teachers' interest due to the presence of and/or interaction with bused minority students.

Another item to measure the attitudes of white receiving students is designed to assess their self-perceptions of their own racial prejudice. Does interaction with bused minority students heighten or decrease white students' perceptions of their own racial prejudice. Responses to this item (Question 37, Form A) are found in Table 43. Differences between the black and total white responses are insignificant with the majority of the students of both races perceive little racial prejudice in themselves. Responses among white students are significantly different, however, with a statistically significant larger number of white students from receiving schools expressing moderate prejudice. The largest proportion of students who perceive themselves as having little prejudice are white students from non-receiving schools. Since almost all of the non-receiving schools have minority students in attendance, support is generated for the proposition that gradual school desegregation and integration may lower prejudice levels much more effectively than rapid school desegregation.

TABLE 42 PERCEPTIONS OF TEACHER INTEREST BY RACE OF RESPONDENT AND RECEIVING SCHOOL STATUS

Black		808	20%	100% (116)

Chi Square = 10.067 With 1 D.F. Significance = .005

Turning to an analysis of attitudes toward integration among white students, a similar pattern emerges. Table 44 presents student responses to Question 38, Form A. The question raised with the inclusion of this item is whether attendance at receiving schools affects white student attitudes toward integration in general. All differences in this table are statistically significant. 85% of the black students have positive attitudes toward general racial integration in society. A significantly smaller proportion of white students (62%) are positive. Differences between whites from receiving and non-receiving schools reveal that white students from receiving schools have the most negative attitudes toward integration. Unless there are other differences between whites in receiving and non-receiving schools that this research project failed to observe, the proposition strongly suggested by the data is that white student attitudes toward integration are strongly affected by the type of school attended. students in receiving schools manifest the smallest proportion of positive attitudes toward integration.

One final item included in this section concerns student attitudes toward busing. Given the distribution of responses in Table 44, one would expect white students in receiving schools to be least in favor of busing (Question 39, Form A). Table 45 presents the data for this item. All differences are statistically significant. A significantly higher percentage of black students (46%) are in favor of busing than white students (26%). In addition, whites from receiving schools are significantly less in favor of busing than their white peers in non-receiving schools. The evidence strongly suggests that type of school exerts a significant effect upon white student attitudes toward busing. The effect of busing on white students in receiving schools is to weaken their support of busing and appreciation of it as a means for school desegregation.

The purpose of this section is to determine what white student attitudes are toward busing and school deseg-Generally speaking, white students would like the racial composition of teachers and the student body in their schools to be more than half white. The majority of white students perceive their teachers to be interested in them, perceive little racial prejudice in themselves, are generally favorable to integration in society, but are overwhelmingly against busing minority students to achieve school desegre-Of special interest are the significant differences in attitudes between white students in receiving schools and non-receiving schools. While rival hypotheses are not controlled in this section, the data support the hypothesis that school type seriously affects white student attitudes. The experience of attending a receiving school appears to produce certain changes in white student attitudes; changes including an increased desire for more white students at school, lowered perceptions of teacher interest, greater

perception of self-prejudice, decreased support for integration and greater resistance to the concept of busing as a means to achieve school desegregation. A tentative proposition offered on the basis of the data presented in this section is that white student attitudes appear to be significantly related to whether the student attends a school that was gradually desegregated (the case with most of the non-receiving schools in this study) or a school that was rapidly desegregated (the receiving schools in this study). While the degree to which differences in white student attitudes affect the attitudes, experiences and educational achievement of bused minority students awaits presentation in the next chapter, it suffices to conclude this section reiterating the significantly different attitudes of white students in receiving and non-receiving schools.

## C. Attitudes of Receiving School Teachers

An important component of the attitudes of both bused minority students and white receiving students are the attitudes and behavior of teachers in the receiving schools. Teachers play a crucial role in setting the tone and climate of interracial acceptance in the receiving school. question to be discussed in this section is whether attitudes of receiving school teachers toward busing, integration and school desegregation are significantly different from teachers in non-receiving schools. If teacher attitudes at receiving and non-receiving schools differ significantly, they become a candidate for the explanation of attitude and behavior differences among bused minority students. Table 46 presents selected characteristics of the teachers surveyed in this Responses of teachers to all items in Questionnaire C (Appendix D) are available on request from the principal investigator, but were deemed unnecessary to include in this Marginal statistics reveal expected distributions with respect to race, sex, age and education categories. Table 47 presents differences in teachers' responses to the question of the percentage of white students counselled or taught (Question 18, Form C). Response differences between receiving school teachers and non-receiving school teachers are statistically significant. Teachers in receiving schools are more likely to teach and counsel white students than teachers in non-receiving schools. This reflects the larger proportion of minority students in non-receiving schools which were desegregated gradually due to changing neighborhood minority concentrations. Receiving schools are still predominantly white. A second reason for results of this table involve the occasional classroom segregation of minority students at receiving schools.

Chi Square =

The racial composition of teachers in receiving and non-receiving schools is presented in Table 48. Differences are not significant. This table was included to indicate that differences in receiving school and non-receiving school teachers' attitudes are not due to the racial distribution of teachers in the two types of schools. Minority group teachers are evenly distributed at both receiving and non-receiving schools.

TABLE 48 TEACHERS' RACE BY TEACHERS RECEIVING SCHOOL STATUS

Teachers' Receiving School Status	Anglo	Teachers' Black	Race Mexican American	Tota	al

Chi Square = 3.831 With 2 D.F. Significance = .1857

Several items indicate teachers in the two types of settings view their environments quite differently. Table 49 presents teachers' attitudes toward the effectiveness of administration leadership (Question 43j, Form C). A significantly higher proportion of receiving school teachers rate administration leadership as non-effective. Support is provided for the suggestion that receiving school teachers are less satisfied with their teaching positions than nonreceiving school teachers. The relation between teachers' receiving school status and perception of staff cooperation (Question 43h, Form C) is presented in Table 50. Differences are statistically significant, with a higher proportion of receiving school teachers perceiving staff cooperation as non-harmonious. Teachers in non-receiving schools were significantly more likely to view staff relations as cordial and cooperative. The third item which indicates that teachers in the two settings view their environments differently concerns the methods used to predict student success

(Question 19, Form C). Table 51 reveals significant differences between teachers especially with reference to the use of teacher recommendations and personality inventories to predict student success. Teachers from receiving schools are much more likely to rely on recommendations and less likely to rely on intelligence scores, aptitude scores, as personality inventory scores.

Non-Receiving School	81%	19%	100%
Total	70%	30%	100% (183)

Chi Square = 4.943 With 1 D.F. Significance = .0512

Further investigation into the attitudinal differences between teachers in receiving and non-receiving schools indicate substantial variation in attitudes toward school socio-economic composition and receiving/non-receiving school status (Question 14, Form C). Differences are statistically significant, with a greater proportion of receiving school teachers desiring schools with students of professional and white collar parents than non-receiving school teachers. Table 53 presents data for teacher's preferences as to ethnic composition (Question 15, Form C). A significantly higher proportion of receiving school teachers prefer a predominantly Anglo-Saxon school ethnic composition. Interestingly, only a few teachers prefer a school with blue collar socio-economic composition or a school with a predominantly ethnic minority composition. Table 54 presents data for teachers' preferences as to school racial composition (Question 17, Form C). ferences are statistically significant and are most striking.

Whereas 72% of receiving school teachers prefer an all white or mostly white school racial composition, only 29% of non-receiving school teachers prefer such settings. Clearly, receiving school teachers overwhelmingly prefer segregated conditions. Non-receiving school teachers are less likely to have a preference as to racial composition, and when they do it is mostly likely to be for desegregated conditions (35% for half white and half non-white). Thus, while receiving school teachers are being asked to assume the task of educating lower socio-economic bused minority students, they are significantly more likely to prefer all white Anglo-Saxon higher socio-economic climate schools. Such disparities undoubtedly exert an influence on the experience of the bused black student and will determine, in part, his perception of the interracial climate of the receiving school.

Differences in attitudes discussed in the previous paragraph should exert an effect on the degree to which teachers perceive the quality of interracial relationships; i.e., on the degree to which they perceive their schools interracial climate as being cordial and accepting. teacher prefers to teach all white, anglo-saxon, higher socio-economic level students, that teacher is likely to perceive a school setting in which minority students are bused through court order to achieve desegregation, as extremely frustrating. Frustrations such as these certainly will color the teacher's perceptions of the degree of interracial acceptance. Table 55 presents data for teachers' perceptions of the degree of racial and ethnic cooperation in their schools (Question 43b, Form C). A significantly greater proportion of receiving school teachers perceive the level of interracial and ethnic cooperation in their schools to be poor. Teachers' attitudes toward school busing policies are also influenced by the setting in which they teach. Table 56 presents data for teachers' reponses to busing policy preferences (Question 20, Form C). Receiving school teachers are significantly less likely to be in favor of busing both white and black students and most likely to favor busing only to the students' neighborhood school. Receiving school teachers favor a busing policy that would make the smallest amount of change in terms of school desegregation.

If all of the differences in receiving and non-receiving school teacher's attitudes examined in the last two paragraphs are as substantively significant as they are statistically, teachers might be expected to appraise and evaluate their minority students differently. Teachers were asked to respond to questions 10 and 11 on Form C with reference to the minority students they taught. Table 57 presents data for the relationship between teacher ratings of minority student academic ability and teacher's receiving school status. Results in Table 57 are statistically significant. Receiving school teachers are much more likely to

give lower academic ratings for the minority students they teach. Whereas receiving school teachers rated 15% of their minority students as excellent or good, non-receiving school teachers rated 35% of their minority students in these categories. Table 58 presents data for the relationship between teacher's receiving school status and teacher ratings of minority student motivation and effort. Again, differences are statistically significant. Receiving school teachers are much more likely to view minority students as lacking in motivation and not making an appropriate effort to master subjects. Non-receiving school teachers are more likely to view their minority students as adequately motivated, making as much of an effort as others. Results of Tables 57 and 58 coupled with information from other research on the effects of teacher's expectations on student academic performance, indicates the differential in teacher's evaluations of academic ability and motivation be considered as a primary candidate to explain differences in bused and non-bused minority student achievement.

From the examination of the relationship between the type of school at which the teacher is employed (receiving and non-receiving) and selected attitudinal items from Questionnaire Form C for teachers, it is concluded that teachers differ significantly in the two settings. Receiving school teachers are more likely to evaluate school administration leadership as ineffective and staff relations in their school as uncooperative. In addition, receiving school teachers prefer to teach mostly white, anglo-saxon, higher socio-economic students, favor busing policies that restrict busing to neighborhood schools and are more likely to perceive racial and ethnic relations in their school as non-cooperative. Finally, receiving school teachers are more likely to rate minority students as having less academic ability and less motivation than minority students rated by non-receiving school teachers. The major conclusion of this section is that significant differences do exist between the attitudes and expectations of receiving school teachers and non-receiving school teachers; and that these differences are likely candidates to explain achievement performance differences between bused and nonbused minority students.

#### D. School Climates of Interracial Acceptance

In addition to the importance of minority student attitudes toward school desegregation for subsequent achievement performance, the degree of interracial acceptance or interracial hostility at school may contribute significantly to the experiences and behavior of minority students. Two approaches are utilized to measure interracial climates in

TABLE 58 TEACHER RATINGS OF MINORITY STUDENT EFFORT BY TEACHER'S RECEIVING SCHOOL STATUS

Teacher's Receiving	St	tudent I	Effort Rat:	ing		
School Status	Excellent	Good	Average	Fair	Poor	Total

Chi Square = 21.85 With 4 D.F. Significance = .0000

this study. The first approach combines responses of teachers and white students to selected items into an index of interracial acceptance. Details on the construction of this index are found in Appendix A. This approach attempts to measure the quality of the interracial climate "objectively." Dividing the index score at the median and crosstabulating with receiving school status produces the distribution presented in Table 59. While the number of schools in each category is small and no attempt has been made to estimate the statistical significance of this distribution, the trend is clear. A smaller proportion of receiving schools have positive index scores, indicative of interracial acceptance. Receiving school interracial climates are predominantly hostile; non-receiving school climates are predominantly accepting. Due to the method of index construction, the measure of interracial climate under consideration here is extremely relative.

TABLE 59 INDEX SCORES FOR SCHOOL INTERRACIAL CLIMATE BY RECEIVING/NON-RECEIVING SCHOOL STATUS

School Status	Index Score of  Positive (Acceptance)	Interracial Cl Negative (Hostility)	imate Total
Receiving School	20%	80%	100% (5)
Non-Receiving School	67%	33%	100% (6)
Total	46%	54%	100% (11)

The second measure of interracial climate used in this study attempts to tap a subjective dimension, by considering the perceptions of minority students. Regardless of the "objective" interracial climate, it is the individual minority student's perception of that climate, whether it corresponds to an objective measure or not, that will exert the greatest effect on that student's subsequent attitude formation and educational experience. This second measure is derived from a factor analysis of selected items (see Appendix A) and represents that factor identified as student perception of

school interracial climate. Data for this factor, cross-tabulated with student busing status, are presented in Table 60. While students perceptions are not uniform, certain patterns are present. Bused students are more likely to perceive their interracial climate as hostile than non-bused students. Non-bused student perceptions of interracial climate are significantly more positive, indicating an interracial climate of warmth and acceptance. Whether these differences exert a significant effect on achievement performance will be explored in the next chapter.

The goal of this chapter has been to present data for the second research objective of this study, viz., to determine majority and minority student attitudes toward busing and school desegregation, and to determine the degree of interracial acceptance in Waco schools. Bused and non-bused black student attitudes are remarkably similar. The majority of black students do not view busing positively although they are in favor of school desegregation and integration. The majority of white students are also in favor of school desegregation but are overwhelmingly critical of busing to achieve it. White students at receiving schools are even more critical of busing and are generally less favorable toward school integration than white students at non-receiving schools. Teachers at receiving schools are more likely to rate minority students as possessing less academic ability and less motivation to succeed than teachers at non-receiving schools. Receiving school teachers are generally less accepting of busing as a means to achieve school desegregation. Finally, objective and subjective measures of a schools interracial climate reveals the majority of receiving schools to have hostile interracial climates (represented by the combined response of teachers and white receiving school students); climates which bused students are less likely to perceive as accept-In the following chapter, multivariate analyses of these and other factors are presented, to explain the achievement performance differences described in Chapter III.

#### CHAPTER V

#### DETERMINANTS OF MINORITY STUDENT

#### ACHIEVEMENT PERFORMANCE

The third objective of this research is to identify and evaluate major determinants of minority student achievement performance. In particular, this project seeks to identify the effects of student self-concept, attitudes toward busing and interracial climate of acceptance on changes in achievement performance of bused and non-bused black students. Correlation and regression analysis is utilized to evaluate the contribution of independent variables to variance in the dependent variable with all other test factors controlled. After identifying major determinants of bused minority student achievement, and the achievement performance of non-bused minority students, a summary of the most important factors will be presented.

#### A. Bused Student Achievement

In intercorrelation matrix for all variables, scales and indices theoretically relevant to the achievement of bused minority students may be found in Appendix F. 61 presents the results of separate regressions run for each of the dependent variables used to measure student achievement. Coefficients in the table are standarized regression coefficients which have been summed to show the total effect of non-interval scale parent variables (Lyons, 1971). Coefficients under X<sub>16</sub> in the table are the relative effects of the independent factors on the dependent variablesof California Achievement Test Math Scores, 1973. From the bottom of the table it is observed that  $R^2 = .590$ , or that 59% of the variance in Math Scores for bused students is explained by the independent factors in the table. The value of .01 for F indicates the level of significance attained by the F ratio. As expected, measured intelligence (X<sub>15</sub>)

The relationship is positive, indicating students with higher intelligence have higher math scores. The next two most important variables are parental educational encouragement

- $X_{21}$  = Battery Score Change, 1971-1973

 $(X_1)$  and respondent's self-concept  $(X_0)$ . Parental discipline and socialization techniques (X3) is the next most important variable to explain bused student math achievement. The children of parents who show an interest in their child's education, ask questions about school work and life, who actively encourage their children to continue their education, who explain parental decisions and use psychological rather than physical types of discipline have higher math achievement scores. While there is not room to comment on all of the factors, two more variables need to be mentioned. A moderate effect on math achievement is exerted by respondent's racial prejudice score (X<sub>7</sub>). The negative sign before the coefficent indicates more highly prejudiced students have lower math The other variable about which some comment is in order is the socio-economic climate of the school  $(X_{g})$ . relationship is so weak that it fell below the .010 inclusion level value. Glancing ahead in the table, one observes that the socio-economic climate of the school is a significant determinant of reading scores ( $X_{17}$ ) but not math scores ( $X_{16}$ ). The Coleman Report (1966) which produced great impetus for a discussion of school socio-economic climate used reading test scores as measures of achievement.

The second column in the table presents regression coefficients for reading achievement scores in 1973 (X17). 70.9% of the variance in reading achievement scores among bused students is explained by the factors in the table. Again, measured intelligence  $(X_{15})$  exerts the largest effect on reading achievement, followed by school socio-economic climate (Xo). This finding is consistent with Coleman Report (1966) data. The next two most important factors for the explanation of reading achievement scores are the respondent's racial prejudice  $(X_7)$  and self-concept  $(X_9)$ . Bused students with low amounts of racial prejudice and positive self-concepts tend to have higher reading achieve-The next most important factor is the respondent's attitude toward busing  $(X_{1,1})$ . Bused students with positive attitudes toward busing manifest higher reading achievement Busing attitude has no effect, however, on math scores (X<sub>16</sub>). A moderate effect is exerted by the respondent's subjective perceptions of the school's interracial climate  $(X_{14})$ . Perceptions of the interracial climate as accepting are associated with higher reading achievement scores. objective measure of interracial climate  $(X_{13})$  does not affect reading scores although it does exert some influence on math scores  $(X_{16})$ .

The third column of Table 61 gives the standardized regression coefficients for the dependent variable of total California Achievement Test Battery scores, 1973. As expected, measured intelligence  $(X_{15})$  again explains the greatest amount of variance in total battery scores of bused minority students. Respondent's racial prejudice  $(X_7)$  and self-concept  $(X_9)$  are the next most important determinants

of battery scores. Parental authority structure  $(X_2)$  and integration attitudes  $(X_{10})$  are next. Students from families with a democratic authority structure and with positive attitudes toward integration have higher test battery scores. Both objective  $(X_{13})$  and subjective  $(X_{14})$  measures of interracial climate exert a weak but significant erfect on battery scores. School socio-economic climate  $(X_8)$  has dropped out of the equation. The most consistent determinants for all three measures of achievement in 1973 are measured intelligence  $(X_{15})$ , racial prejudice  $(X_{2})$  and self-concept  $(X_{3})$ . Generally speaking, bused students with higher intelligence, positive self-concepts and less racial prejudice have higher achievement test scores.

Of course, the achievement scores of bused students in 1973 represents only one period in time and may not give a true picture of the achievement changes of bused students. The last three columns in Table 61 present regression coefficients for math, reading and battery score changes between 1971 and 1973, the period in which these students have been bused. Column four gives coefficients for the dependent variable of math score change from 1971-1973. The factor that exerts the greatest effect on changes in math scores is the perceived interracial climate  $(X_{1A})$ . Bused students who have positive perceptions of accepting interracial climate have less of a decline in math scores. Bused students who have negative perceptions of school interracial climate show the greatest decline in math scores. The second most important factor is measured intelligence  $(X_{15})$  followed by racial prejudice  $(X_7)$  and the objective measure of school interracial climate  $(X_{1:3})$ . Bused students are likely to show less decline in their math scores only if their preceptions of the interracial climate are positive, if the interracial climate is actually positive and accepting, if they have little racial prejudice, and if they have higher intelligence.

For the dependent variable of changes in reading scores  $(X_{20})$ , a slightly different picture emerges. Measured intelligence  $(X_{15})$  has the largest effect on reading score change followed by integration attitudes  $(X_{10})$ , racial prejudice  $(X_{20})$  and self-concept  $(X_{20})$ . Bused students who show the greatest loss in reading achievement scores are those who are lower in intelligence, have less favorable attitudes toward integration, have greater racial prejudice and less favorable self-concepts. School socio-economic status  $(X_{20})$ 0 exerts a moderate effect on changes in bused student reading achievement scores, with minority students bused to higher socio-economic climate schools showing smaller reading scores declines. Perceived interracial climate  $(X_{14})$ 0 exerts only a weak effect on reading score change.

The final column in Table 61 presents regression coefficients for the dependent variable measuring the change in total battery scores between 1971 and 1973  $(X_{21})$ .

Measured intelligence  $(X_{15})$  has the greatest effect on battery score changes followed by racial prejudice  $(X_7)$ , self-concept  $(X_9)$  and integration attitudes  $(X_{10})$ . Bused students with smallest losses in test battery scores are those with higher measured intelligence, less racial prejudice, positive self-concept and attitudes favorable to integration. School educational climate  $(X_{12})$  and school interracial climate  $(X_{13})$  also exert a moderate effect on changes in battery scores, with smaller achievement losses coming from situations in which the educational climate of the school is encouraging and supportive, and the interracial climate is accepting.

The relative strengths of independent factors vary with different measures of achievement. Nevertheless several factors consistently exercise strength across all measures of achievement. The most important of these factors is measured intelligence, which exercises an effect on all 6 achievement measures, and exercises the largest effect on 5 of the 6 measures. The second most important factor for all dependent variables is the respondent's racial prejudice level. Consistently, higher achievement scores are associated with lower levels of racial prejudice. Self-concept is next in importance, followed by student perception of the interracial climate. Two additional variables exercise effects for all of the achievement measures; parental authority structure and respondent's educational expectations. Other variables which exercise an effect on 5 of the 6 measures of achievement include school interracial climate, school educational climate, school socio-economic climate, parental socio-economic status and parental educational encouragement.

To summarize this section, it is observed that while data from Chapter III indicate that bused students on the average did less well than non-bused students on achievement tests after the two year period of busing, the factors identified above determine the actual achievement performance for each bused student. Bused minority students will not show a large decline in achievement, indeed may even show gains in achievement scores, only to the extent that they have a combination of high intelligence, little racial prejudice, positive self-concept, come from families with democratic authority structures, manifest high educational expectations, perceive their school's interracial climate as accepting, attend schools with higher educational and socio-economic climates and come from families of higher socio-economic status that encourage educational performance.

#### B. Non-Bused Student Achievement

This section investigates the determinants of achievement for non-bused minority students. An intercorrelation

matrix for all variables, scales and indices theoretically relevant to the achievement of non-bused minority students may be found in Appendix F. Table 62 presents the results of separate regressions for each of the dependent achievement variables. Generally speaking, less variance is explained among non-bused students than among bused students, and F ratio levels are less significant. For the dependent variable of math achievement scores, intelligence  $(X_{15})$ , school educational climate  $(X_{12})$ , respondent's perceptions of school interracial climate  $(X_{14})$  and busing attitudes  $(X_{11})$  exercise the largest effects, in that order. Non-bused students with higher intelligence, perceptions of an accepting interracial climate, favorable attitudes toward busing and attendance in achools with high educational climates have higher math achievement test scores.

For the dependent variable of reading scores, intelligence  $(X_{15})$  is again the strongest factor, followed by parental socio-economic status  $(X_4)$  and parental discipline and socialization techniques  $(X_3)$ . Respondent perception of school interracial climate  $(X_{14})$  also makes a moderate contribution to reading achievement. For both math score and reading score dependent variables, school socio-economic climate  $(X_8)$  exercises a moderate effect. Looking across the table, school socio-economic climate has an effect on all measures of achievement for non-bused minority students. Non-bused students have higher reading achievement scores to the extent that they have higher intelligence, come from higher socio-economic level families that have utilized rational explanations and psychological discipline techniques and have favorable perceptions of their school's interracial climate.

For the dependent variable of total battery scores, 1973, measured intelligence  $(X_{15})$  again exerts the strongest effect. The next strongest determinants are parental socialization techniques  $(X_3)$ , respondent's educational expectations  $(X_5)$  and school socio-economic status  $(X_6)$ . Non-bused students are more likely to have higher battery scores if they have higher intelligence, have been raised in a family which uses psychological rather than physical punishment and discipline, have high educational expectations and attend a higher socio-economic climate school.

For the dependent variables of changes in achievement scores  $(X_{19}, X_{20}, X_{21})$ , two factors exercise a strong consistent effect: measured intelligence  $(X_{15})$  and respondent perception of school interracial climate  $(x_{14})$ . Higher intelligence non-bused minority students who perceive the interracial climates of their schools as accepting, show the smallest declines in achievement scores; some, even show gains. Other significant factors exercising effects on achievement score changes are parental authority structure  $(X_2)$ , school educational climate  $(X_{12})$  and busing attitudes  $(X_{11})$ .

- $X_{17} =$ Reading Scores, 1973
- $X_{18} = Battery Scores, 1973$
- $X_{19} = Math Score Change, 1971-73$
- $X_{20}$  = Reading Score Change, 1971-73
- $X_{21}$  = Battery Score Change, 1971-73

While the relative strengths of factors varies with different measures of achievement, several factors consistently exercise strength across all measures of achievement. The most important of these is measured intelligence  $(X_{15})$  followed by student perception of school interracial climate  $(X_{14})$ . Other significant factors include respondent's educational expectations  $(X_5)$ , school socio-economic climate  $(X_8)$  and self-concept  $(X_9)$ . Variables which exercise an effect on 5 of the 6 achievement measures include parental socialization technique  $(X_3)$ , sex of respondent  $(X_6)$ , racial prejudice scale  $(X_7)$ , busing attitude scale  $(X_{11})$  and school educational climate  $(X_{12})$ .

To summarize this section on the determinants of non-bused minority student achievement, it is observed (from Chapter III) that non-bused students had the smallest declines in achievement scores. Many showed gains. Non-bused minority students will show small declines, and perhaps gains in achievement scores, to the extent that they have a combination of high intelligence, positive perceptions of their school's interracial climate, high educational expectations, positive self-concepts and attend higher socio-economic climate schools. Other conditions that encourage small declines in achievement include rational and psychological parental socialization techniques, low racial prejudice levels, positive attitudes toward busing and attendance at a school with an encouraging educational climate.

#### C. Self-Concept and Measured Intelligence

If the four most important determinants of bused student achievement scores are listed (measured intelligence, racial prejudice, self-concept and respondent's educational expectations) and are compared with the four strongest determinants of non-bused student achievement (measured intelligence, perception of interracial climate, school socio-economic climate and self-concept) two factors are found to be included in both lists: self-concept and measured intelligence. Table 63 presents the results of separate regressions run for the dependent variables of self-concept and measured intelligence for bused and non-bused minority students. the logic of the causal priorities in regressing self-concept and measured intelligence on the independent factors is valid, then it may be observed that the independent factors considered in this study exert a significant effect on both self-concept  $(X_0)$  and measured intelligence  $(X_{15})$ . For bused students, the two most significant factors exerting pressure on self-concept are the two measures of school interracial climate  $(X_{13} \text{ and } X_{14})$ . Perceived interracial climate also exercises the greatest effect on measured intelligence  $(X_{15})$ . For non-bused students, respondent's educational expectations

 $X_{15}$  = Measured Intelligence

(X<sub>5</sub>) and busing attitudes (X<sub>11</sub>) exercise the largest effect on self-concept, with educational expectations (X<sub>5</sub>) having the greatest effect on measured I.Q. While the causal ordering here is debatable these equations were included to provide a fuller picture of the effects of the independent factors, and to indicate the importance of school interracial climate for bused students. Due to the unresolved debate concerning the proper ordering of motivational, intellectual and background variables (Bloom, 1964; Hauser, 1971; Rehberg, Schafer and Sinclair, 1970; and Turner, 1964), no attempt will be made to construct a path model of the variables under consideration. Instead, the path analytic notation will be used to evaluate those factors making the greatest direct contribution to minority student achievement and achievement change.

### D. Selected Determinants of Achievement For Bused Minority Students

One final method of evaluating determinants of bused student achievement involves the use of path coefficients and correlation coefficients to observe and compare direct versus indirect effects of variables. Factors which have a proportionately larger direct effect on the dependent variable offer the greatest opportunity for manipulation and possible change. Factors which have a proportionately large indirect effect, owe their strength to their relationship to other factors and do not present as great a potential for manipulation. In the following tables, the direct effect is defined as the path coefficient. The total indirect effect is the correlation (r) between an independent variable and a dependent variable minus the direct effect. The indirect effect is itself a combination of the effect of one variable through paths of other variables (in a causal model) and the effects due to correlation with other variables (the "joint" effect). Table 64 presents direct and indirect effects for all of the independent factors on the three dependent variables of math, reading and battery scores for bused students in 1973. If an independent variable contributes a larger direct effect, it is concluded to exercise primarily a direct effect. Thus far the dependent variable of battery scores, direct effects are exercised by parental authority structure  $(X_2)$ , parental socialization technique  $(X_3)$ , integration attitudes  $(X_{10})$ , school interracial climate  $(X_{13})$  and measured intelligence  $(X_{15})$ . For the three dependent variables in the table, four factors exercise primary direct effects: parental authority structure, parental socialization technique, school interracial climate and measured intelligence. Of these four, the variable most easy to manipulate is school interracial climate.

Table 65 presents direct and indirect effects for the three dependent variables of math score changes, reading score and battery score changes for bused students. A larger number of variables exercise direct effects, thereby offering a larger number of opportunities for social intervention and manipulation. Variables exercising direct effects for two or more of the three dependent variables include parental authority structure  $(X_2)$ , racial prejudice  $(X_7)$ , integration attitudes  $(X_{10})$ , school educational climate  $(X_{12})$ , school interracial climate  $(X_{13})$  and measured intelligence  $(X_{15})$ . With the exception of parental authority structure and measured intelligence, all of these factors are fairly amenable to programs designed for change. Thus, some of the negative effects of busing for the achievement performance of bused minority students might be altered and offset.

#### CHAPTER VI

#### SUMMARY AND CONCLUSIONS

A brief summary and conclusions for each of the major research objectives are presented in this chapter as well as several limitations that need to be taken into account in the interpretation of the study findings.

#### A. Achievement Score Change

The first objective of this research is to ascertain whether court ordered busing of minority group students in Waco, Texas, has increased, decreased, or not affected the achievement levels of bused students compared with non-bused students. From the review of literature on studies in this area, contradictory findings were observed. While some studies suggest increases in achievement accompany bused minority students (East Harlem Project, 1962; Syracuse City School District, 1967), others report no such increases (Teele, Jackson and Mayo, 1966; Moorefield, 1967). Other literature, based on research in desegregated schools, contends minority students should be positively benefited by contact with "middle-class" white students (Katz, 1964; Katz, 1968; and Pettigrew, 1971).

Based on the results of this study, the following summary and conclusions are tended. Prior to busing, no significant differences in achievement performance were observed between minority students about to be bused to previously all white schools (a fact unknown to them or the school district at the time of testing) and minority students not to be assigned to be bused. After the passage of two years, during which time some of the minority students in this study were bused to previously all white schools, both bused and non-bused minority students showed a decline in level of achievement performance. Differences between bused and non-bused minority student achievement scores widened, with bused student averages significantly lower than non-bused student averages. T-tests reveal bused student reading scores and total battery scores to be significantly lower than those of non-bused students. While the

trend for math score differences is the same, statistical significance was not reached.

In an attempt to observe whether achievement differences between bused and non-bused students were due to the effects of some other antecedent or intervening variable, respondent's sex, age, grade, measured intelligence and socio-economic status were controlled as test factors. Only measured intelligence was significantly related to any of the achievement variables. Controls for measured intelligence reduce the magnitude of differences between bused and non-bused achievement scores, but differences due to busing status remain statistically significant, with the exception of math score differences among bused and non-bused students with lower measured intelligence.

Measured intelligence, when controlled, also reduced the magnitude of differences between bused and non-bused student achievement score changes. Significant differences remained for both reading score changes and total battery score changes between bused and non-bused students. The major conclusion of this first section is that in the two year period of court-ordered busing to desegregate Waco schools, the achievement of bused minority students was seriously eroded in comparison with that of non-bused minority students. While both bused and non-bused students achieved less well at the end of the two year period, the achievement performance of bused students was significantly lower.

#### B. Student and Teacher Attitudes

The second objective of this research is to determine majority and minority student attitudes toward busing and the degree of interracial acceptance in Waco schools. tral to this objective are the concerns raised in the literature as to the effect of white majority students in receiving schools for bused minorities. Katz (1964) suggests a great amount of psychological stress and anxiety experienced by minority students may impair or retard their achievement performance. Such stress and anxiety may be generated by the minority students' attitudes and psychological state, by the climate of acceptance-rejection created by white students and/or receiving school teachers or a combination of all three. Thus, it was deemed important to observe the attitudes of all three (minority students, majority students and receiving school teachers) to determine the climate of interracial relationships. Aspects of this climate approximate Pettigrew's (1971) distinction between "desegregated" and "integrated" settings and may determine, in part, the achievement performance differences between bused and non-bused minority students.

Based on the results of this study, the following summary and conclusions are tended. Bused and non-bused minority student attitudes toward integration, school desegregation, classroom composition and busing are remarkably similar. While differences between bused and non-bused minority students toward busing are not statistically significant, only 9% of minority students have a positive attitude toward bus-54% are neutral and 38% negative. Neither bused nor non-bused students view busing as a risk to health or as hindering the learning process. The lack of positive attitudes toward busing is reflected in the overwhelming support given to two alternatives to busing: upgrading substandard schools and redistributing quality teachers. While bused and nonbused students do not differ on many items the parents of these students do. 70% of the parents of non-bused students have positive appraisals of their child's school, compared with 35% of the parents of bused students. Bused and nonbused students differ most significantly on the racial composition of school desired and the degree to which they perceive their teachers to be interested in them. Non-bused students prefer integrated settings; bused students, less Non-bused students are more likely to perceive teacher interest. It is the conclusion of this study that busing does not contribute significantly to changes in minority student attitudes. Trends are somewhat opposite the predicted direction, with bused students having slightly less favorable attitudes toward desegregation and integration.

White receiving school students, on the other hand, do appear to have significantly different attitudes than white non-receiving school students. White receiving school students are less likely to favor integration, less likely to favor busing, less likely to perceive teacher interest, want a higher proportion of whites in the classroom, perceive greater racial prejudice in themselves and are less likely to favor school desegregation. A major conclusion of this study concerns the effects of rapid versus gradual school desegregation. Since white students in non-receiving schools have a larger proportion of minority students than receiving schools (most non-receiving schools were desegregated gradually), and since whites in non-receiving schools are significantly more positive concerning desegregation, integration and busing than whites in receiving schools, evidence is presented to show that gradual school desegregation is more beneficial to the development of friendly and cooperative interracial relations than rapid school desegregation.

Receiving school teacher attitudes also differed significantly from those of teacher's in non-receiving schools. Receiving school teachers are more likely to desire to work in schools with a high proportion of middle class, white, anglo-saxon students, more likely to view interracial relations in their school as non-cooperative and to view

staff relations as less harmonious. The most significant differences occurred with ratings of minority student academic ability and motivation to learn. A significantly higher proportion of receiving school teachers rated minority students as having lower ability and less motivation than non-receiving school teachers. A major conclusion of this section is that differences in teachers' evaluations of the academic ability and effort of minority students should be considered as a primary determinant of achievement performance differences between bused and non-bused students.

Finally, the responses of teachers and white students were combined to generate a measure of the interracial climate of the school. As expected from the response differences between receiving and non-receiving school teacher and white students, the interracial climate in receiving schools was observed to be less cooperative and accepting than non-receiving school climates. To check on the validity of this measure and to provide a subjective measure of interracial climate, a factor scale of interracial climate was generated from the subjective responses of bused and non-bused minority students. Bused students scored significantly lower on the scale indicating less positive perceptions of their school's interracial climate.

#### C. Determinants of Achievement

The third objective of this research is to evaluate the degree to which bused student attitudes, majority student attitudes, student self-concept and the school's interracial climate determine the achievement performance of bused minority students. Based on the results of this study, the following summary and conclusions are tended. While different factors exercise relatively more or less of an effect for specific measures of achievement, several variables appear most significant for the achievement performance of bused minority students. They include measured intelligence, racial prejudice level, and self-concept. Generally speaking, bused students with higher intelligence, less racial prejudice and positive self-concepts had higher achievement scores on the 1973 California Achievement Test.

The major determinants of changes in achievement scores for bused minority students include perceived interracial climate, objective interracial climate, intelligence, self-concept and school socio-economic status. Generally speaking, bused students with higher intelligence, less racial prejudice, positive self-concepts, and favorable perception of their school's interracial climate showed smaller declines in achievement. Combining measures of achievement change with measures of 1973 achievement test scores reveals the

following factors to exercise the greatest effect for bused student achievement: measured intelligence, racial prejudice level, self-concept, perception of interracial climate, parental authority structure and respondent's educational expectations. The major conclusion of this study concerning the determinants of bused minority student achievement is that bused students manifest smaller losses in achievement, even show small gains, to the extent that they have a combination of higher intelligence, little racial prejudice, positive self-concept, high educational expectations, perceive their school's interracial climate as accepting and come from families which have democratic authority structures.

For non-bused minority students, a similar set of factors determine 1973 achievement scores and changes in Major determinants include measured intelliachievement. gence, perception of school interracial climate, self-concept, educational expectations and school socio-economic climate. Non-bused student achievement scores manifest less decline, even increases, to the extent that they have a combination of higher intelligence, positive self-concept, high educational expectations, perceive their school's interracial climate as accepting and attend schools of higher socioeconomic climate. Almost identical factors operate to determine bused student and non-bused student achievement performance. This indicates that differentials with respect to these factors determine achievement differences. major conclusion of this section, indeed of the whole study, is that differences in the experiences between bused and non-bused students with respect to school interracial climate, attitudes toward busing and desegregation, which in turn affect self-concept, account for bused and non-bused student achievement differences and account for the significant decline in bused student achievement.

An attempt was conducted to evaluate which factors offer the greatest potential for social scientists, school personnel and others to manipulate and change in order to alter this situation. School interracial climate, level of racial prejudice and integration attitudes consistantly exercise direct effects on bused student achievement and appear, therefore, to be most amenable to change.

The overall conclusion of this study is that the effects of busing minority students to desegregate schools are deleterious to the achievement performance of bused students. This relationship is highly influenced by the attitudes of white receiving school students and receiving school teachers so that it is difficult to know whether this study's results are the effects of busing, generally, or whether they are specific to the particulars of Waco, Texas. A limitation of this study is that only one school district was studied. Moorefield (1967) and Purl and Dawson (1971) provide support to suggest the interracial climate of

receiving schools determine whether the bused student experience is negative or positive. School interracial climate depends, in part, on whether schools are desegregated rapidly or gradually. If as in Waco, busing is ordered to achieve rapid school desegregation and there is strong school and community resistance to such busing, then the results are likely to replicate the achievement declines of the bused students of this study.

Perception of Interracial Climate.						113
School Interracial Climate		•	•			113
School Socio-Economic Climate		•			•	114
School Educational Climate						114

## Achievement and Achievement Change

Two measures of achievement are utilized in this study: those collected prior to the period of busing and those collected after the two year period of busing which this study covers. Achievement measures prior to the period of busing are the total math scores, total reading scores and total battery scores from the Intermediate Form of the California Achievement Test. This test was administered by Waco Independent School District personnel and student scores were processed from school records. This test was administered during the 1969-1971 school year period to successive classes of students. Nevertheless, all scores were in school records prior to court ordered busing.

Achievement measures after two years of busing are the total math scores, total reading scores and total battery scores from the Advanced Form of the California Achievement Test. This test was administered in the schools, under the direction of a research consultant for this study, during the spring of 1973.

Achievement changes were derived by simply subtracting the total math, reading and battery scores from the before period, from their respective counterparts for the 1973 period for each student.

## Measured Intelligence

Measured Intelligence is defined as total I.Q. scores from the California Test of Mental Maturity administered by the Waco Independent School District as a regular part of their testing program. All scores were processed prior to the period of busing covered in this study.

## Parental Socio-Economic Status

Parental Socio-Economic Status is defined as the Hollingshead Two Factor Index of Social Position (1957) which combines educational and occupational scores for father or head of household. Questions 10, 11, 12 1972 Questionnaires, Form A and B.

## Parental Educational Encouragement

Kahl (1953), Bordua (1960) and Rehberg (1965) report higher achievement expectations for students from families in which parents value education sufficiently to encourage their children to continue their education beyond the high school level. Conceptually, parental educational orientation refers to the amount of encouragement parents give their children to do well in school and continue their education. Operationally, it is defined by an index which combines respondent's scores for two items: frequency of paternal encouragement (Question 18, Forms A and B) and frequency of maternal encouragement (Question 20, 1972 Questionnaires, Forms A and B). Index scores range from 1, low encouragement; to a value of 10, high encouragement.

# Parental Authority Structure

Elder (1963) summarizes prior research on parental authority structure with the suggestion that the most fruitful approach should concentrate on the type of role relationship between the parent and child in the child rearing process. Elder suggests a "democratic" type of authority pattern, which allows for greater interdependence between parents and children with respect to family decisionmaking, is conducive to high achievement. Rehberg (1965) and Douvan and Adelson (1966) report a democratic parentchild authority pattern is more congruent with the type of child rearing process which facilitates an easy internalization of parental values. Parental authority structure is operationalized by an index which combines paternal and maternal decision-making (Question 17 and 19, 1972 Questionnaires, Forms A and B). Index scores range from the value of 1, authoritarian; to a value of 10, democratic authority structure.

## Parental Socialization and Discipline Technique

Parental socialization and discipline technique is conceptually defined as the type of discipline and method of socialization a child receives while growing up. Douvan and Adelson (1966) report the use of indirect controls, i.e., psychological rather than physical discipline and rewards leads to the internalization of parental achievement values. Elder (1963) reports higher achievement among adolescents from homes in which parental power is perceived as both reasonable and rational, and in which discipline is psychological rather than physical. Parental socialization and discipline techniques is operationalized by an index combining maternal and paternal discipline techniques (Questions 17 and 20, 1971 Questionnaire Appendix C). Index scores range from a low of 1, authoritarian; to 8, democratic.

## Respondent's Educational Expectations

Educational expectations are defined as the realistic expectations of a student to continue his education beyond the high school level. Research by Rehberg (1967) has provided support for the relationship between expectations and earlier formulations of achievement values (Rosen, 1956; 1959). Students with high educational expectations are also those with strong achievement values. Educational expectations are operationalized by Question 52, 1972 Questionnaire, Forms A and B.

# Racial Prejudice Scale

A number of items theoretically related to a respondent's racial prejudice were submitted to factor analysis using the principal components solution to factor analysis, programmed in the Statistical Package For The Social Sciences (Nie, Bent and Hull, 1971). Items that loaded on this factor included Questions 30, 41 and 46 1973 Questionnaire, Form D. The factor scale ranges from a low of -1.286 to a high of 1.606. The mean score is .402 with a standard deviation of .710.

## Self-Concept Scale

Self-concept is conceptually defined as a set of beliefs and attitudes an individual has internalized about himself and his relationship to his physical and social environment. This concept is operationalized by a factor scale which was computed on measures of self-concept utilized by the Office of Education Survey (Coleman, 1966) combined with measures of mobility attitudes (Rehberg, 1970). Individual items include measures of an individual's sense of control of his

environment (Coleman, 1966:288) with measures of education, mastery and time orientation isolated by Rehberg's (1970: 36-39) analysis of material from Rosen (1956), Strodbeck (1958) and Kahl (1965). These items are Questions 28, 41-48, 50 in the 1972 Questionnaire Forms A and B. The factor scale ranges from a low of -4.947 to a high of 3.054. The mean score is .114 and the standard deviation is 1.718.

## Integration Attitude Scale

Integration attitudes are defined as attitudes toward general social and racial integration in society. This concept is operationalized by a factor scale computed on Questions 31 and 38, 1973 Questionnaire, Form D. The factor scale ranges from a low of -2.528 to 2.472 with a mean score of -.018 and a standard deviation of .824.

#### Busing Attitude Scale

Busing attitudes are operationalized by a factor scale computed on Questions 32, 43, 44, 45 and 48 of 1973 Question-naire, Form D. The factor scale ranges from a low of -2.124 to 1.494 with a mean of -.013 and a standard deviation of .830.

## Perception of Interracial Climate

The student's perception of his school's interracial climate is operationalized by a factor scale computed for the responses of black students to Questions 28, 29, 33, 35, 52-60, 1973 Questionnaire, Form D. The factor scale ranges from a low of -1.402 to 2.884 with a mean of .271 and a standard deviation of .951.

# School Interracial Climate

The objective measure of school interracial climate is operationalized by a factor scale computed for the responses of teacher and white students to the following items: Questions 26, 27, 28, 34, 38 and 39, 1972 Questionnaire A; and Questions 9, 10, 11, 13, 17 and 43 b, h, i, from 1972 Questionnaire, Form C. The factor scale ranges from a low of -5.438 to 8.741 with a mean score of .376 and a standard deviation of 2.727.

#### School Socio-Economic Climate

School climate is defined as the "contextual" effect of the school on the individual student's behavior. (McDill, Meyers, and Rigsby, 1967:182). Measures of the school socioeconomic climate are based on aggregative characteristics of schools which are derived from data from individual student's socio-economic status. School socio-economic climate is composed of measures derived from Questions 10, 11 and 12 1972 Questionnaires, Forms A and B.

## School Educational Climate

School educational climate is derived in a manner similar to school socio-economic climate and is based on aggregative measures of the educational expectations and parental educational encouragement of students in the school. Questions 18, 20 and 52, 1972 Questionnaires, Forms A and B.

APPENDIX C. QUESTIONNAIRE FOR FIRST WAVE OF DATA COLLECTION, SPRING, 1971

## PURPOSE OF THE RESEARCH

This study is being conducted by the Human Relations Commission of The City of Waco, Texas, in several area schools. The purpose of the study is to determine the level of Waco dropout rates and to understand some of the reasons as to why students drop out of school. There are no right or wrong answers to this questionnaire. No one in your school or your community will ever see your questionnaire or your responses. After we have identified your questionnaire with your student number and received your attendance records from the school, this front page will be removed and your answers will be strictly anonymous. Please answer each item to the best of your ability. By reading each item carefully and by answering each item honestly, you can personally help to make this survey a true reflection of student life.

#### INSTRUCTIONS

- 1. A number of items use the terms "mother" and "father". If you are currently living with your natural mother and father, these terms should be taken to mean your natural mother and father. If you are not currently living with your natural mother and father, then the terms should be taken to mean your stepmother, stepfather, female guardian or male guardian.
- 2. Most of the items in the questionnaire can be answered by placing an (X) in the parenthesis to the left of the response choice which you select as your best answer.

A sample item would be :

21.	Which	sport	do you	like	best?
	1	( )	Tonni	-	

2. (X) Football

2. (X) FOOTBALL 3. ( ) Baseball

This answer indicates that this person likes football best.

3. A number of items contain a choice category of "other". If none of the choices fits your particular situation, place an (X) in the category marked "other", and then specify the answer which best fits you.

APPENDIX D. QUESTIONNAIRES FOR SECOND WAVE OF DATA COLLECTION, SPRING, 1972

Form A For Non-Bused Students

Form B For Bused Students

Form C For Teachers

#### THE WACO DROPOUT AND ACHIEVEMENT STUDY

Form A

This study is being conducted by the Research Development Foundation in several area schools. The purpose of the study is to understand some of the reasons as to why students drop out of school and why student achievement is higher in some schools than others. There are no right or wrong answers to the questionnaire. No one in the community will ever see your questionnaire or your responses. Please answer each item to the best of your ability. By reading each item carefully and by answering each item honestly, you can personally help to make this study a true reflection of school life.

#### INSTRUCTIONS

Most of the items in the questioncaire can be answered by placing an (x) in the parenthesis to the left of the response choice which you select as your best answer.

#### Sample Item

- 1. Which sport do you like best?
  - 1. ( ) Tennis
  - 2. (X) Football
  - 3. ( ) Baseball

This answer indicates this person likes football best.

THANK YOU FOR YOUR HELP.

# THE WACO DROPOUT AND ACHIEVEMENT STUDY

Form B

This study is being conducted by the Research Development Foundation in several area schools. The purpose of the study is to understand some of the reasons as to why students drop out of school and why student achievement is higher in some schools than others. There are no right or wrong answers to the questionnaire. No one in the community will ever see your questionnaire or your responses. Please answer each item to the best of your ability. By reading each item carefully and by answering each item honestly, you can personally help to make this study a true reflection of school life.

## INSTRUCTIONS

Most of the items in the questioncaire can be answered by placing an (x) in the parenthesis to the left of the response choice which you select as your best answer.

#### Sample Item

- Which sport do you like best?
  - 1. ( ) Tennis
  - 2. (X) Football
  - 3. ( ) Baseball

This answer indicates this person likes football best.

1.	Are 1. 2.		a 1	male or fema Male Female	ale?

#### THE WACO DROPOUT AND ACHIEVEMENT STUDY

Form C

This study is being conducted by the Research Development Foundation in several area schools. The purpose of the study is to understand some of the reasons as to why students drop out of school and why student achievement is higher in some schools than others. There are no right or wrong answers to the questionnaire. No one in the community will ever see your questionnaire or your responses. Please asswer each item to the best of your ability. By reading each item carefully and by answering each item honestly, you can personally help to make this study a true reflection of your situation.

### - INSTRUCTIONS

Most of the items in the questionnaire can be answered by placing an (x) in the parenthesis to the left of the response choice which you select as your best answer.

## Sample Item

- 1. Which sport do you like best?
  - A. ( ) Tennis
  - B. (X) Football
  - C. ( ) Baseball

This answer indicates this person likes football best.

1.	What A. B.	i is (	)	our sex? Male Female		
2.				our age?		
	Α.	(	•	Under 26		
		(		2t to 35		
	C.		-	30 to 45		
	D.	•		46 to 55		
	Ε.	•		56 to 65		
	F.	(	)	65 or older		
3.	Are	yо	u.			
	A.	(	)	American Indian		
	В.	(	)	Black		
	C.	(	)	Chicano		
	D.	(	)	Oriental		
	Ε.	(	)	White		
	F.	(	)	Other		
		(	)	works as more than one.  Technical - such as draftsman, surveyor, medical or dent nician, etc.  Official - such as manufacturer, officer in a large comp government official or inspector, etc.  Manager - such as a sales manager, store manager, office factory supervisor, etc.	any, ba	nker er,
				Proprietor or Owner - such as owner of small business, w retailer, contractor, restaurant o		
	C.	(	)	Clerical worker - such as bankteller, bookkeeper, sales office clerk, messenger, mail carrier,	clerk,	
				Salesman - such as real estate salesman or insurance, et		
				Protective Worker - such as policeman, detective, sherif	f, fire	-
		,	,	man, etc.	•	
	D.	(	)	Workman or Laborer - such as factory or mine worker, fil station attendant, fisherman, etc.	ling	
				Service worker - such as barber, waiter, etc.

## THE WACO DROPOUT AND ACHIEVEMENT STUDY

Form D

This study is being conducted in several area schools. The purpose of the study is to understand some of the reasons as to why students drop out of school, why student achievement is higher in some schools than others, and to evaluate the use of busing to achieve racial balance in Waco schools. There are no right or wrong answers to the questionnaire. No one in the community will ever see your questionnaire or your responses. Please answer each item to the best of your ability. By reading each item carefully and by answering each item honestly, you can personally help to make this study a true reflection of student life.

#### INSTRUCTIONS

Most of the items in the questionnaire can be answered by placing an ( X ) in the parenthesis to the left of the response choice which you select as your best answer.

#### Sample Item

- 1. Which sport do you like best?
  - 1. ( ) Tennis
  - 2. (X) Football
  - 3. ( ) Baseball

This answer indicates this person likes football best.

Leave numbers 1-10 blank	
1 2.	
3.	
4 9.	
10.	
Begin here.	
11. Are you a male or female? 1. ( ) Male 2. ( ) Female	
12. How old were you on your last  1. ( ) 14 or younger  2. ( ) 15  3. ( ) 16  4. ( ) 17  5. ( ) 18	birthday?
6. ( ) 19 7. ( ) 20 or older 13. Do you have a part-time or fu	11-time ich?
1. ( ) Yes 2. ( ) No	II-time job:
14. If you do have a job, how many 1. ( ) Do not have a 2. ( ) Under 5 hours 3. ( ) 5 - 10 hours 4. ( ) 10 - 15 hours 5. ( ) 15 - 20 hours 6. ( ) 20 - 40 hours 7. ( ) Over 40 hours.	
15. On the average, how many extr you participated in regularly  1. ( ) None  2. ( ) One  3. ( ) Two  4. ( ) Three  5. ( ) Four	a-curricular clubs and activities have this year? 5. ( ) Five 6. ( ) Six 7. ( ) Seven 8. ( ) Eight or more
16. How long have you lived in or	year ears ars years

60.	Do you have a closer association with students from your school or friends from your neighborhood?  1. ( ) Students from school 2. ( ) Friends from the neighborhood 3. ( ) Both - They are the same 4. ( ) Neither
61.	If we said that a close f end is a person who really accepts you as a person, someone with whom you like to discuss things, someone whom you enjoy being with; would you say that you have many friends among the teachers at the school you are attending?  1. ( ) Yes, I have many friends among the teachers 2. ( ) I have a few friends among the teachers 3. ( ) No, I do not have any friends among the teachers
62.	How many close friends do you have among the students at your school?  1. ( ) None
63.	How many of your close friends are white?  1. ( ) None 2. ( ) Less than half 3. ( ) About half 4. ( ) More than half 5. ( ) All
64.	If you could have anyone you wanted for close friends, how many of them would be white?  1. ( ) None 2. ( ) Less than half 3. ( ) About half 4. ( ) More than half 5. ( ) All
65.	Concerning your dating activity, about how often do you go out on dates in a month?  1. ( ) Do not date
66.	How often do you date a person of another race?  1. ( ) Do not date 2. ( ) I*do date, but have never dated a person of another race 3. ( ) Have once or twice 4. ( ) Fairly regularly 5. ( ) Often 6. ( ) All the time
67.	How long have you been dating inter-racially?  1. ( ) Do not date persons of another race  2. ( ) Less than one year  3. ( ) One to two years  4. ( ) Over two years

68.	If you do date persons of another race, check as many of the following responses as apply to you.												
	1. ( ) Do not date persons of another race 2. ( ) Because most of my friends do 3. ( ) Because none of my friends do 4. ( ) Its the most popular thing to do 5. ( ) Its the most unpopular thing to do 6. ( ) No special reason - a date from one race is just the same as a date from another race 7. ( ) Because I believe in racial integration 8. ( ) Other												
69.	If you do not date those of another race, check as many of the following responses as apply to you.  1. ( ) Parents do not approve 2. ( ) Friends do not approve 3. ( ) I do not want to 4. ( ) Do not know anyone of another race 5. ( ) Do not date 6. ( ) Other												
70.	What do you like most about busing?	_											
72.	What is your objection to busing?												

THANK YOU FOR YOUR COOPERATION
